

Modified dam with normal pool elevation set to height of existing concrete crest

Catwalk over engineered channel connects to existing

Engineered channel for fish passage shown about 150' long for aprox 3-4 foot rise

New waterfront park area and possible sediment management area

Please note that this is a conceptual drawing only. The CAC has not determined on which side of the river the channel should be located. The CAC does recommend the side selected ought to be determined by taking into account maximizing efficacy for fish passage, and structural and maintenance considerations. If feasible, appropriately managed public access is desirable, including portage around the fish channel.
